

MODIFIED HEMOGLOBINS, INCLUDING NITROSYLHEMOGLOBINS,
AND USES THEREFOR

Abstract of the Disclosure

Diseases which can be ameliorated by delivery of NO to tissues affected by the disease can be treated by administration of nitrosyl-heme-containing donors of NO, including nitrosylhemoglobin. Nitrosylhemoglobin can be made by the reaction of NO with hemoglobin under certain conditions in which the NO:hemoglobin ratio is critical, and is converted to SNO-Hb under physiological conditions.
